- System architecture
- Three popular architectural styles
- Security
- Performance

3

 International University, VNU-HCMC

**Design**

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

The requirements describe the function of a system as seen by the client.

For a given set of requirements, the software development team must design a system that will meet those requirements.

In practice requirements and design are interrelated. In particular, working on the design often clarifies the requirements. This feedback is a strength of the iterative and agile methods of software development.

2

4

International University, VNU-HCMC

## Design

We have already looked at user interface design.

```
graph TD; SA((System Architecture)) --- AOD((ASPECTS OF DESIGN)); P((Performance)) --- AOD; S((Security)) --- AOD; PD((Program Design)) --- AOD;
```

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

## Creativity and Design

### Software development

Software development is a craft. Software developers have a variety of tools that can be applied in different situations.

Part of the art of software development is to select the appropriate tool for a given implementation.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

7

International University, VNU-HCMC

## Creativity and Design

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Creativity and design**

System and program design are a particularly creative part of software development, as are user interfaces. You hope that people will describe your designs as “elegant”, “easy to implement, test, and maintain.” Above all strive for simplicity. The aim is find simple ways to implement complex requirements.

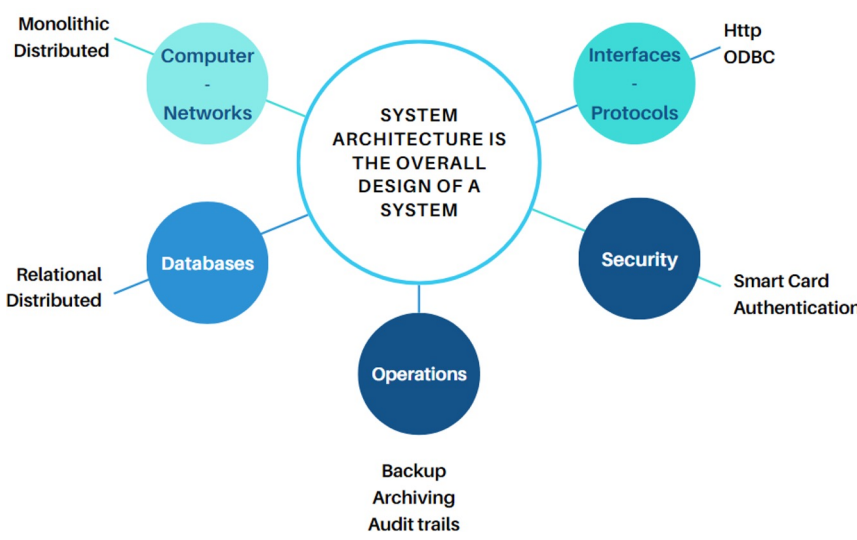

8

International University, VNU-HCMC

## System Architecture

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

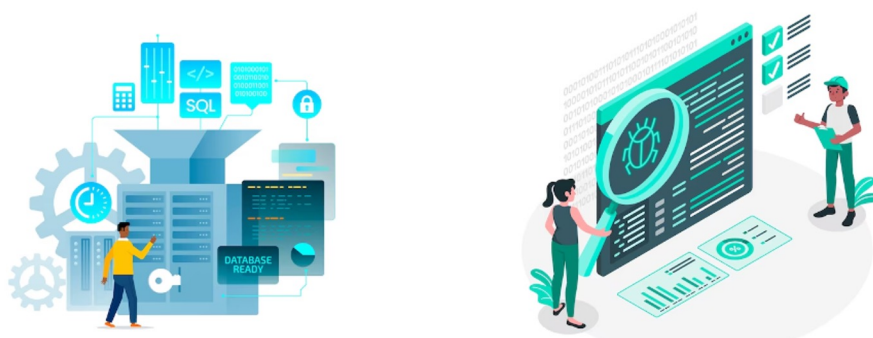

The diagram illustrates the components of System Architecture. A central circle labeled "SYSTEM ARCHITECTURE IS THE OVERALL DESIGN OF A SYSTEM" is connected to five surrounding circles: "Computer Networks", "Interfaces Protocols", "Security", "Operations", and "Databases". Each circle is further associated with specific details: "Computer Networks" (Monolithic, Distributed), "Interfaces Protocols" (Http, ODBC), "Security" (Smart Card Authentication), "Operations" (Backup, Archiving, Audit trails), and "Databases" (Relational, Distributed).

10

International University, VNU-HCMC

## System Architecture

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

The illustration is divided into two parts. On the left, labeled 'Software environments', it shows a person in a yellow shirt interacting with a large blue funnel. Inside the funnel are icons for SQL, a clock, and a gear. To the right of the funnel is a server rack and a box labeled 'DATABASE READY'. On the right, labeled 'Testing frameworks', it shows two people, a woman and a man, looking at a large screen displaying a bug icon and code. There are also checkmarks and a document icon nearby.

Software environments

Testing frameworks

11

International University, VNU-HCMC

## Models for System Architecture

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Our models for systems architecture are based on UML**

The slides provide diagrams that give an outline of the systems, without the supporting specifications.

For every system, there is a choice of models

Choose the models that best model the system and are clearest to everybody.

When developing a system, every diagram must have supporting specification.

The diagrams shows the relationships among parts of the system, but much, much more detail is needed to specify a system explicitly.

12

International University, VNU-HCMC

## Subsystems

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

A subsystem is a grouping of elements that form part of a system.

- **Coupling** is a measure of the dependencies **between two subsystems**. If two systems are strongly coupled, it is hard to modify one without modifying the other.
- **Cohesion** is a measure of dependencies **within a subsystem**. If a subsystem contains many closely related functions its cohesion is high.

An ideal division of a complex system into subsystems has low coupling between subsystems and high cohesion within subsystems.

13

International University, VNU-HCMC

## Component

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

OrderForm

A **component** is a replaceable part of a system that conforms to and provides the realization of a set of interfaces.

A component can be thought of as an implementation of a subsystem.

**UML definition of a component**

"A distributable piece of implementation of a system, including software code (source, binary, or executable), but also including business documents, etc., in a human system."

14

International University, VNU-HCMC

## Components as Replaceable Elements

COMPONENTS ALLOW SYSTEMS TO BE ASSEMBLED FROM BINARY REPLACEABLE ELEMENTS

A component is bits not concepts

A component can be replaced by any other component(s) that conforms to the interfaces

A component is part of a system

A component provides the realization of a set of interfaces

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

16

International University, VNU-HCMC

## Components and Classes

**Classes** represent logical abstractions. They have attributes (data) and operations (methods).

**Components** have operations that are reachable only through interfaces.

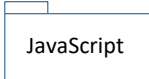

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

18

 International University, VNU-HCMC

## Package

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

JavaScript

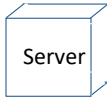

A **package** is a general-purpose mechanism for organizing elements into groups.

19

 International University, VNU-HCMC

## Node

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Server

A node is a physical element that exists at run time and provides a computational resource, e.g., a computer, a smartphone, or a router.

Components may live on nodes.

20

International University, VNU-HCMC

## Example: Simple Web System

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

The diagram illustrates a simple web system. On the left, a person is sitting at a desk with a laptop, labeled "Web browser". A horizontal line connects this to a box on the right labeled "Web server".

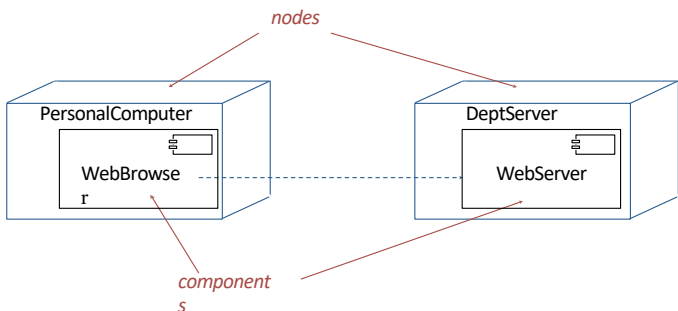

- Static pages from server
- All interaction requires communication with server

21

International University, VNU-HCMC

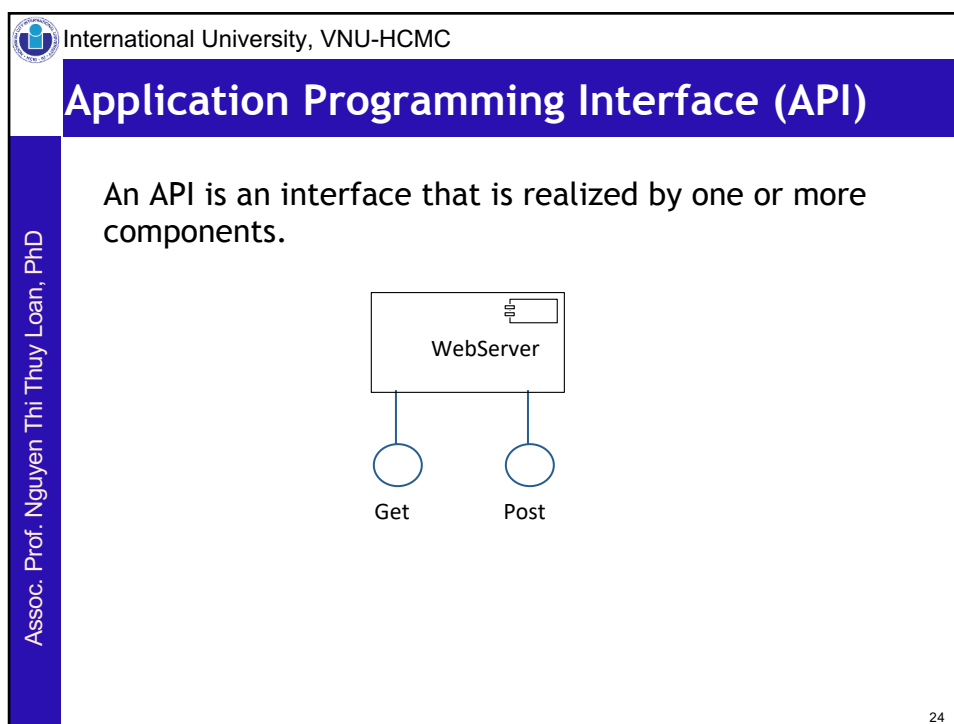

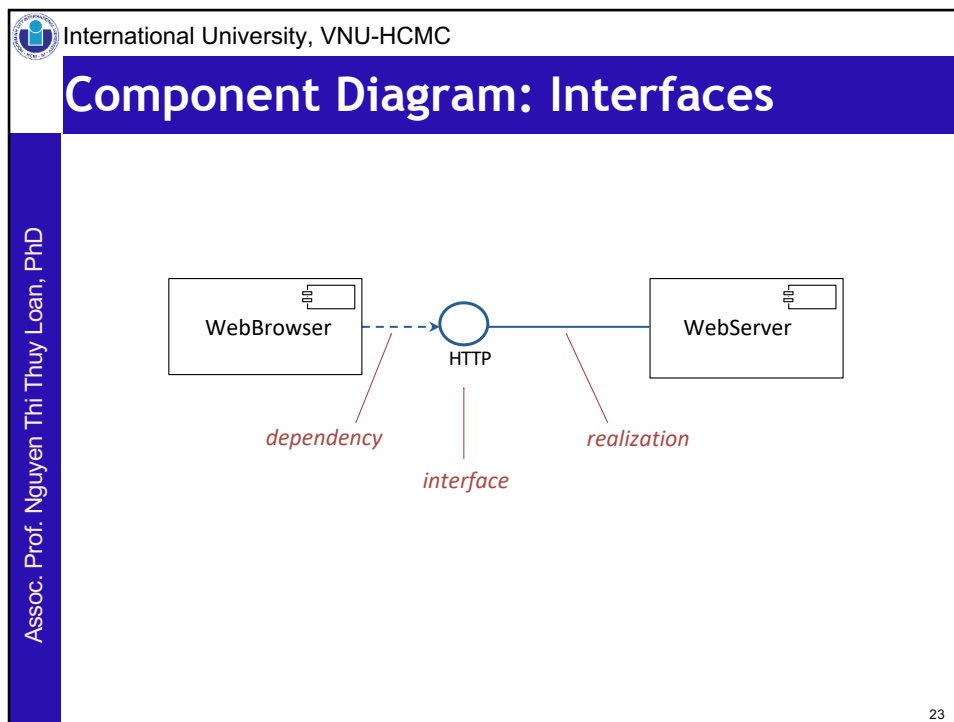

## Deployment Diagram

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

The diagram is a UML Deployment Diagram. It shows two nodes: "PersonalComputer" and "DeptServer". Inside "PersonalComputer" is a component "WebBrowse". Inside "DeptServer" is a component "WebServer". A dashed line connects "WebBrowse" to "WebServer". Red arrows point from the labels "nodes" and "components" to their respective elements in the diagram.

22

International University, VNU-HCMC

## Architectural Styles

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

An **architectural style** is system architecture that recurs in many different applications.

See:

- <https://www.castsoftware.com/glossary/what-is-software-architecture-tools-design-definition-explanation-best>
- Mary Shaw and David Garlan, *Software architecture: perspectives on an emerging discipline*. Prentice Hall, 1996
- David Garlan and Mary Shaw, An Introduction to Software Architecture. Carnegie Mellon University, 1994  
[http://www.cs.cmu.edu/afs/cs/project/able/ftp/intro\\_softarch/intro\\_softarch.pdf](http://www.cs.cmu.edu/afs/cs/project/able/ftp/intro_softarch/intro_softarch.pdf)

25

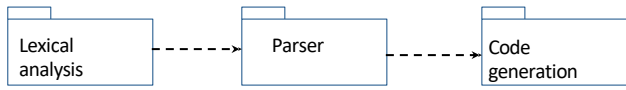

International University, VNU-HCMC

## Architectural Style: Pipe

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Example: A three-pass compiler

```

graph LR
    A[Lexical analysis] -.-> B[Parser]
    B -.-> C[Code generation]
            
```

Output from one subsystem is the input to the next.

26

International University, VNU-HCMC

## Architectural Style: Client/Server

Example: A mail system

The control flows in the client and the server are independent.  
Communication between client and server follows a protocol.

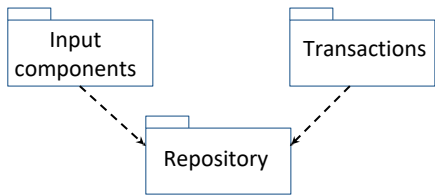

In a peer-to-peer architecture, the same component acts as both a client and a server.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

27

International University, VNU-HCMC

## Architectural Style: Repository

Advantages: Flexible architecture for data-intensive systems.

Disadvantages: Difficult to modify repository since all other components are coupled to it.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

28

International University, VNU-HCMC

## Architectural Style: Repository with Storage Access Layer

This is sometimes called a "glue" layer

Advantages: Data Store subsystem can be changed without modifying any component except the Storage Access.

29

International University, VNU-HCMC

## Time-Critical Systems

**A time-critical (real time) system is a software system whose correct functioning depends upon the results produced and the time at which they are produced.**

**A hard real time system fails if the results are not produced within required time constraints**  
e.g., a fly-by-wire control system for an airplane must respond within specified time limits

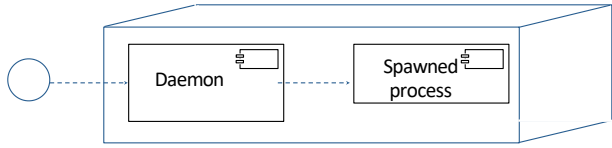

**A soft real time system is degraded if the results are not produced within required time constraints**  
e.g., a network router is permitted to time out or lose a packet

31

International University, VNU-HCMC

## Time Critical System: Architectural Style-Daemon

A **daemon** is used when messages might arrive at closer intervals than the time to process them.

Example: Web server  
 The daemon listens at port 80  
 When a message arrives it:  
 spawns a processes to handle the message returns to listening at port 80

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

32

International University, VNU-HCMC

## Architectural Styles for Distributed Data

**Replication:**  
 Several copies of the data are held in different locations.  
 Mirror: Complete data set is replicated  
 Cache: Dynamic set of data is replicated (e.g., most recently used)  
 With replicated data, the biggest problems are concurrency and consistency.

**Example:** The Domain Name System  
 For details of the protocol read:  
 Paul Mockapetris, "Domain Names - Implementation and Specification". IETF Network Working Group, *Request for Comments*: 1035, November 1987.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

33

International University, VNU-HCMC

## An Exam Question

*A company that makes sports equipment decides to create a system for selling sports equipment online. The company already has a product database with description, marketing information, and prices of the equipment that it manufactures.*

*To sell equipment online the company will need to create: a customer database, and an ordering system for online customers.*

*The plan is to develop the system in two phases. During Phase 1, simple versions of the customer database and ordering system will be brought into production. In Phase 2, major enhancements will be made to these components.*

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

34

International University, VNU-HCMC

## An Exam Question

a) For the system architecture of Phase 1:  
a.i) Draw a UML deployment diagram.

```

graph LR
    PC[PersonalComputer] --- WS[WebBrowser]
    SS[ShoppingServer] --- PDB[Product DB]
    SS --- OS[Ordering system]
    SS --- CDB[Customer DB]
    WS -.- OS
  
```

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

35

International University, VNU-HCMC

## An Exam Question

(a) For the system architecture of Phase 1:  
a.ii). Draw a UML interface diagram.

```

graph LR
    WebBrowser[WebBrowser] -.-> OrderingSystem[Ordering system]
    OrderingSystem --- ProductDB[Product DB]
    OrderingSystem --- CustomerDB[Customer DB]
  
```

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

36

International University, VNU-HCMC

## An Exam Question

(b) For Phase 1:

b.i). What architectural style would you use for the customer database?  
Repository with Storage Access Layer

b.ii). Why would you choose this style?  
It allows the database to be replaced without changing the applications that use the database.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

37

International University, VNU-HCMC

## An Exam Question

(b) For Phase 1:  
b.iii). Draw an UML diagram for this architectural style showing its use in this application.

38

International University, VNU-HCMC

## Outlines

- System architecture
- Three popular architectural styles
- Security
- Performance

39

International University, VNU-HCMC

## Three-Tier Architecture

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

The diagram illustrates the Three-Tier Architecture with three components, each represented by a shield icon and a corresponding text box below it:

- What is three-tier architecture and describe?** (Icon: A green shield with a white circle containing a house and three smaller squares below it.)
- Benefits of three-tier architecture** (Icon: A blue shield with a white circle containing a yellow pyramid.)
- Three-tier application in web development** (Icon: A light blue shield with a white circle containing a computer monitor and a stack of three yellow cubes.)

40

International University, VNU-HCMC

## Example 1:

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

### Batch Processing with Master File Update

- Electricity utility customer billing (e.g., NYSEG)
- Telephone call recording and billing (e.g., Verizon)
- Car rental reservations (e.g., Hertz)
- Bank (e.g., Tompkins Trust)
- University grade registration (e.g., IU)

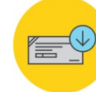

41

International University, VNU-HCMC

## Master File Update

**Example: Electricity Utility Billing** 

Requirements analysis identifies several transaction types:

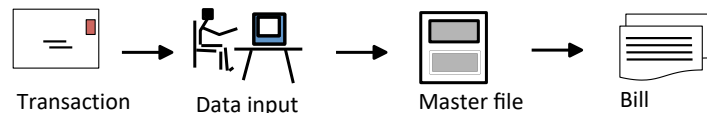

Create account/ close account 	Meter reading 	Payment received 
Other credits/ debits 	Check cleared/ check bounced 	Account query 
		Correction of error 

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

43

International University, VNU-HCMC

## First Attempt

```

graph LR
    Transaction[Transaction] --> DataInput[Data input]
    DataInput --> MasterFile[Master file]
    MasterFile --> Bill[Bill]
  
```

Each transaction is handled as it arrives.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

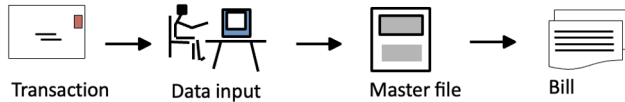

44

International University, VNU-HCMC

## Criticisms of First Attempt

Where is this first attempt weak?

- All activities are triggered by a transaction.
- A bill is sent out for each transaction, even if there are several per day.
- Bills are not sent out on a monthly cycle.
- Awkward to answer customer queries.
- No process for error checking and correction.
- Inefficient in staff time.

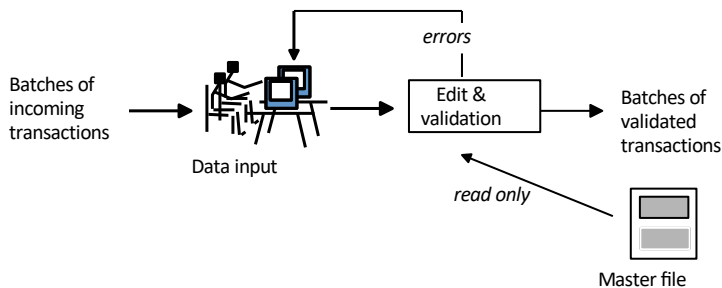

Transaction      Data input      Master file      Bill

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

45

International University, VNU-HCMC

## Batch Processing: Edit and Validation

Batches of incoming transactions      Data input      Edit & validation      Batches of validated transactions

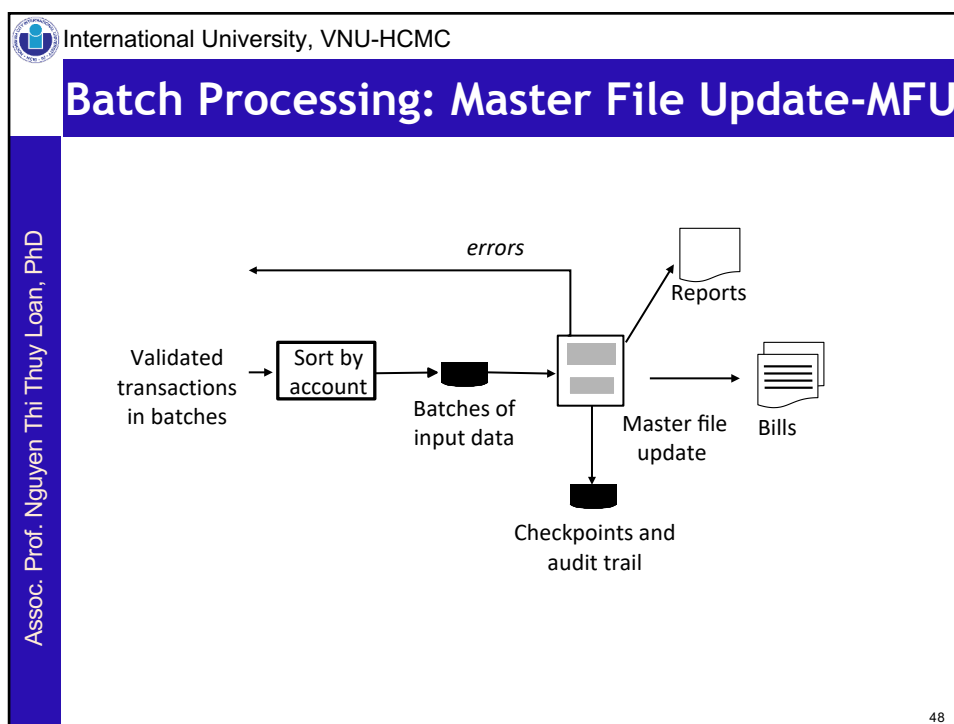

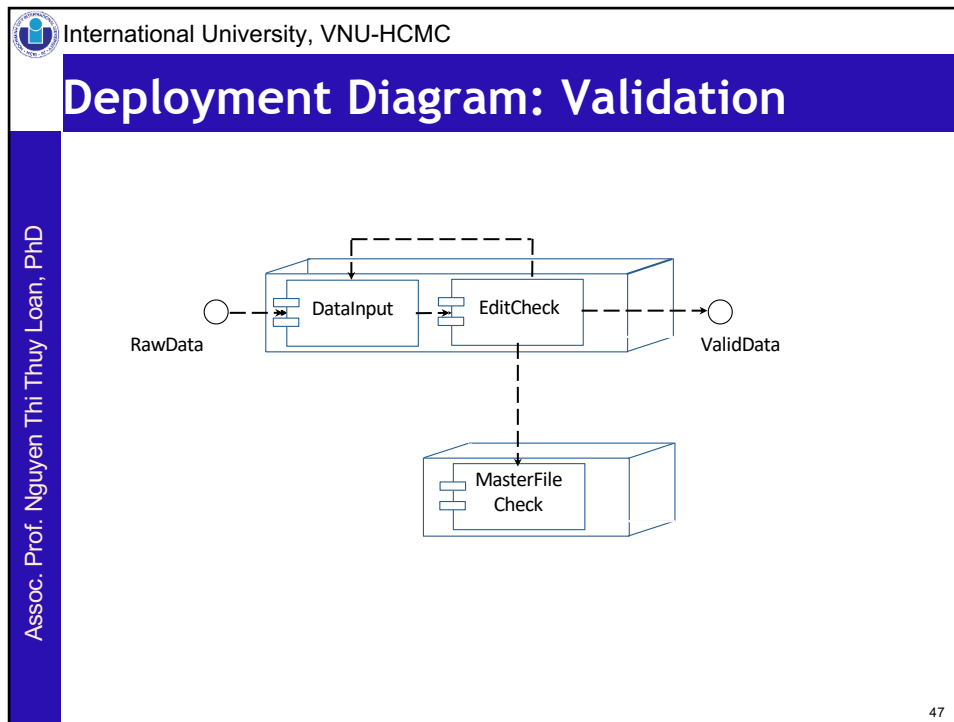

errors

read only

Master file

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

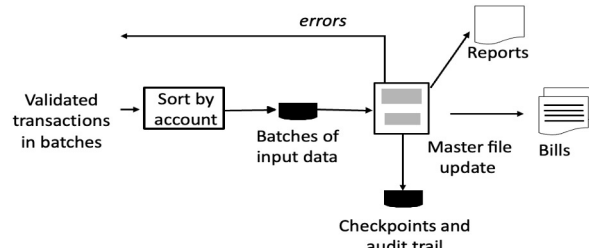

46

International University, VNU-HCMC

## Benefits of Batch Processing with MFU

- All transactions for an account are processed together at appropriate intervals, e.g., monthly.
- Backup and recovery have fixed checkpoints.
- Better management control of operations.
- Efficient use of staff and hardware.
- Error detection and correction is simplified.

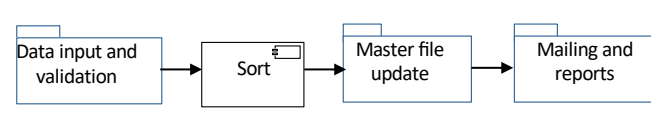

```

graph LR
    A[Validated transactions in batches] --> B[Sort by account]
    B --> C[Batches of input data]
    C --> D[Processing]
    D -- errors --> A
    D --> E[Reports]
    D --> F[Bills]
    D --> G[Master file update]
    D --> H[Checkpoints and audit trail]
  
```

49

International University, VNU-HCMC

## Architectural Style: MFU (Basic Version)

```

graph LR
    A[Data input and validation] --> B[Sort]
    B --> C[Master file update]
    C --> D[Mailing and reports]
  
```

**Advantages:**  
Efficient way to process batches of transactions.

**Disadvantages:**  
Information in master file is not updated immediately. No good way to answer customer inquiries.

50

International University, VNU-HCMC

## Online Inquiry

A customer calls the utility and speaks to a customer service representative.

Customer service Representative

read only

New transaction

Master file

Customer service department can read the master file, make annotations, and create transactions, but cannot change the master file.

51

International University, VNU-HCMC

## Online Inquiry: Use Case

CustomerRepresentative

AnswerCustomer

<<uses>>

NewTransaction

The representative can read the master file, but not make changes to it.

If the representative wishes to change information in the master file, a new transaction is created as input to the master file update system.

52

International University, VNU-HCMC

## Architectural Style: Master File Update (Full)

```

graph LR
    A[Data input and validation] --> B[Sort]
    B --> C[Master file update]
    C --> D[Mailing and reports]
    C --> E[Customer service]
    E --> A
  
```

**Advantage:**  
Efficient way to answer customer inquiries.

**Disadvantage:**  
Information in master file is not updated immediately.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

53

International University, VNU-HCMC

## Example 2: Three Tier Architecture-TTA

The basic client/server architecture of the web has:

- a server that delivers static pages in HTML format
- a client (known as a browser) that renders HTML pages

Both client and server implement the HTTP interface.

**Problem**

Extend the architecture of the server so that it can configure HTML pages dynamically.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

54

International University, VNU-HCMC

## Web Server with Data Store

Web browser

Server

Data

Advantage:  
Server-side code can configure pages, access data, validate information, etc.

Disadvantage:  
All interaction requires communication with server

55

International University, VNU-HCMC

## Architectural Style: TTA

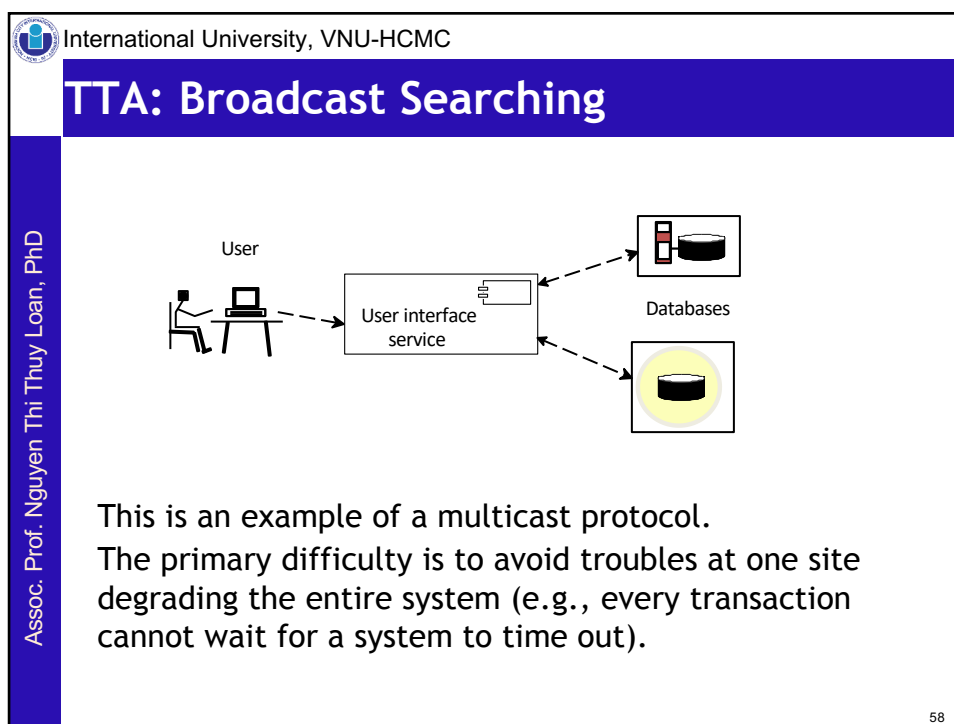

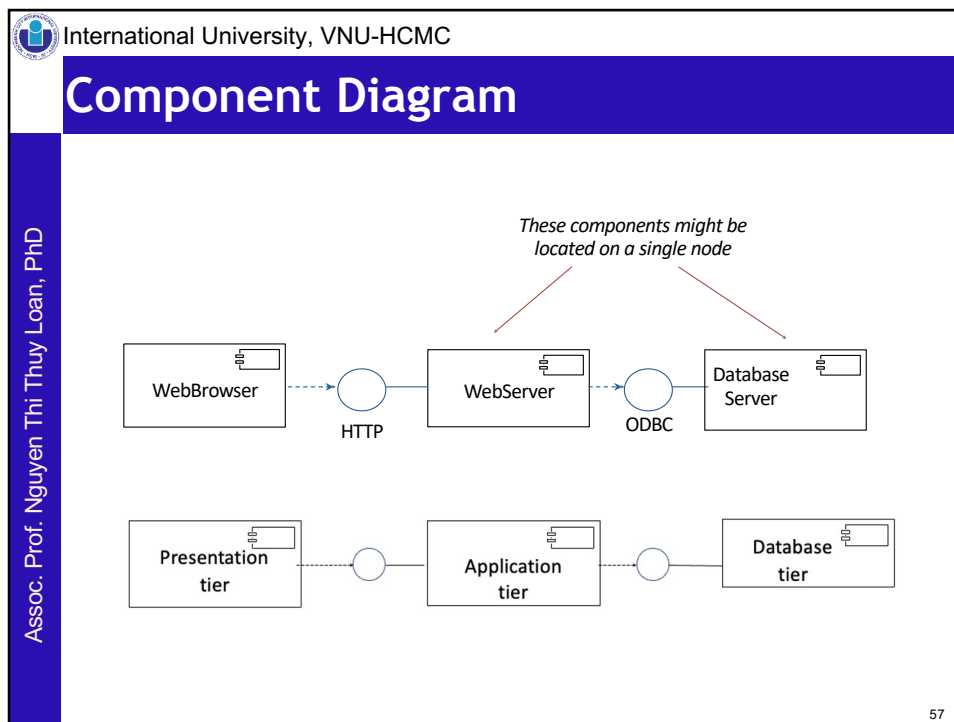

Presentation tier

Application tier

Database tier

Each of the tiers can be replaced by other components that implement the same interfaces

56

International University, VNU-HCMC

## Extending the Architecture of the Web

Using a three tier architecture, the web has:

- a server that delivers dynamic pages in HTML format
- a client (known as a browser) that renders HTML pages

Both server and client implement the HTTP interface. Every interaction with the user requires communication between the client and the server.

**Problem 2**

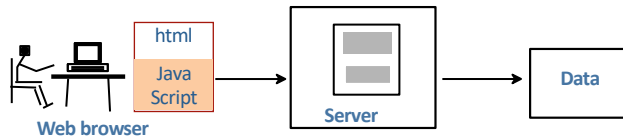

Extend the architecture so that simple user interactions do not need messages to be passed between the client and the server.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

59

International University, VNU-HCMC

## Extending the Web with Executable Code that can be Downloaded

```

graph LR
    WB[Web browser] -- "html, JavaScript" --> S[Server]
    S -- "Data" --> D[Data]
  
```

The diagram illustrates a web browser (represented by a person at a desk with a laptop) sending requests for HTML and JavaScript to a server (represented by a box with a monitor icon). The server then returns data to the browser.

Executable code in a scripting language such as JavaScript can be downloaded from the server

**Advantage:**

Scripts can interact with user and process information locally.

**Disadvantage:**

All interactions are constrained by web protocols.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

60

International University, VNU-HCMC

## Extending the Three Tier Architecture

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

In the three-tier architecture, a website has:

- a client that renders HTML pages and executes scripts
- a server that delivers dynamic pages in HTML format
- a data store

**Further extensions**

- The three-tier architecture with downloadable scripts is one of how the basic architecture has been extended. There are some more:
- Protocols: e.g., HTTPS, FTP, proxies
- Data types: e.g., helper applications, plug-ins
- Executable code: e.g., applets, servlets
- Style sheets: e.g., CSS

61

International University, VNU-HCMC

## Example 3: Model/View/Controller (MVC)

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

The definition of Model/View/Controller (MVC) is in a state of flux. The term is used to describe a range of architectures and designs.

- Some are system architectures, where the model, view, and controller are separate components.
- Some are program designs, with classes called model, view, and controller.

We will look at three variants:

- An MVC system architecture used in robotics.
- A general purpose MVC system architecture used for interactive systems.
- Apple's version of MVC as a program design for mobile apps.

62

International University, VNU-HCMC

## Model/View/Controller in Robotics

Example: Control of an unmanned model aircraft

```

graph LR
    View[View] --> Model[Model]
    Model --> Controller[Controller]
    Controller --> View
    Controller --> Aircraft((Aircraft))
  
```

**Controller:** Receives instrument readings from the aircraft, updates the view, and sends controls signals to the aircraft.

**Model:** Translates data received from and sent to the aircraft, and instructions from the user into a model of flight performance. Uses domain knowledge about the aircraft and flight.

**View:** Displays information about the aircraft to the user on the ground and transmits instructions to the model via the controller.

63

International University, VNU-HCMC

## Example 3: MVC for Mobile Apps

```

graph TD
    View[View] -. "State query" .-> Model[Model]
    Model -- "State change" --> Controller[Controller]
    Controller -- "View control" --> View
    Controller -.-> View
  
```

64

International University, VNU-HCMC

## Model

The model records the state of the application and notifies subscribers. It does not depend on the controller or the view.

01 Stores the state of the application in suitable data structures or databases

02 Notifies subscribers of events that change the state

03 Responds to instructions to change the state information

04 May be responsible for validation of information

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

66

International University, VNU-HCMC

## View

The view is the part of the user interface that presents the state of the interface to the user. It subscribes to the model, which notifies it of events that change the state.

- renders data from the model for the user interface
- provides editors for properties, such as text fields, etc.
- receives updates from the model
- sends user input to the controller

A given model may support a choice of alternative views.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

67

International University, VNU-HCMC

## Controller

The controller is the part of the user interface that manages user input and navigation within the application.

- defines the application behavior
- maps user actions to changes in the state of the model
- interacts with external services via APIs
- may be responsible for validation of information

Different frameworks handle controllers in different ways. In particular there are several ways to divide responsibilities between the model and the controller, e.g., data validation, external APIs.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

68

International University, VNU-HCMC

## External Services for Mobile Apps

Mobile apps often make extensive use of cloud-based external services, each with an API (e.g., location, validation). These are usually managed by the controller.

```

graph TD
    Model[Model] -- "State query" --> View[View]
    View -.-> Model
    View -- "View control" --> Controller[Controller]
    Controller -.-> View
    Controller -- "State change" --> Model
    Controller <--> ES((External services))
  
```

The diagram illustrates the MVC (Model-View-Controller) pattern and its interaction with external services. It shows three main components: Model, View, and Controller, each represented by a box with a small UI icon. 
 

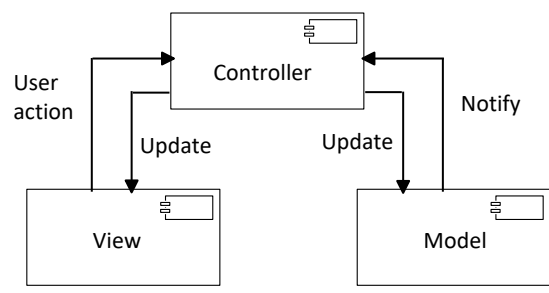

- A solid arrow labeled "State query" points from the Model to the View.
- A dashed arrow points from the View back to the Model.
- A solid arrow labeled "View control" points from the View to the Controller.
- A dashed arrow points from the Controller back to the View.
- A solid arrow labeled "State change" points from the Controller to the Model.
- The Controller is connected to a red circle labeled "External services" via a double-headed arrow.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

69

International University, VNU-HCMC

## Apple's Version of MVC

```

graph TD
    User((User)) -- "User action" --> Controller
    Controller -- "Update" --> View
    View -- "Update" --> Controller
    Controller -- "Update" --> Model
    Model -- "Notify" --> Controller
  
```

The diagram shows the model, view, and controller as components. In practice the Model-View-Controller is a program design with three major classes.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

70

International University, VNU-HCMC

## Apple's Version of MVC

**Two challenges:**

- A multi-screen app will have several views and controllers sharing the same model.
- It is easy to put too much code into the controller.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

71

International University, VNU-HCMC

## Architectural Styles and Design Patterns

There are many variants of the common architectural styles. Do not be surprised if you encounter a variant that is different from the one described in this course.

This is particularly true with the Model-View-Controller style. Several programming frameworks call classes that implement a variant of the Model-View-Controller architectural style a design pattern.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

72

International University, VNU-HCMC

## Architectural Styles and Design Patterns

In this course we distinguish carefully between architectural styles and design patterns.

**Architectural styles are part of system design.** They are defined in terms of subsystems, components, and deployment.

**Design patterns are part of program design.** They are defined in terms of classes.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

73

International University, VNU-HCMC

**Outlines**

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

- System architecture
- Three popular architectural styles
- Security**
- Performance

74

International University, VNU-HCMC

**Security in the Software Development Process**

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**The security goal**

The security goal is to make sure that the agents (people or external systems) who interact with a computer system, its data, and its resources, are those that the owner of the system would wish to have such interactions.

Security considerations need to be part of the entire software development process. They may have a major impact on the system architecture chosen.

75

International University, VNU-HCMC

## Security Needs and Dangers

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Needs**

- Secrecy: control of who gets to read information
- Integrity: control of how information changes or resources are used
- Availability: providing prompt access to information and resources
- Accountability: knowing who has had access to resources

**Dangers**

- Damage to information – integrity
- Disruption of service – availability
- Theft of money – integrity
- Theft of information – secrecy
- Loss of privacy – secrecy

Butler W. Lampson, *Computer Security in the Real World*  
IEEE Computer, June 2004

76

International University, VNU-HCMC

## The Economics of Security

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**How secure should your system be?**

Building secure systems adds cost and time to software development

"Practical security balances the cost of protection and the risk of loss, which is the cost of recovering from a loss times its probability... When the risk is less than the cost of recovering, it's better to accept it as a cost of doing business ... than to pay for better security."

"Many companies have learned that although people may complain about inadequate security, they won't spend much money, sacrifice many features, or put up with much inconvenience to improve it."

Butler W. Lampson, 2004

77

International University, VNU-HCMC

## The Economics of Security

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Credit cards: Option A**

- The card is a plastic card with all data (e.g., name, number, expiration date) readable by anybody who has access to the card. A copy of the signature is written on the card.
- This is a cheap system to implement but does little to discourage fraud.

Banks in the USA have traditionally used this system.

5  
78

International University, VNU-HCMC

## The Economics of Security

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Credit cards: option B (chip and PIN)**

- The card has an embossed security chip. To use the card, a particular reader must read the security chip, and the user must type in a confidential 4-digit number.
- This provides excellent protection against fraud but is more expensive and slightly less convenient for merchants and users.

For many years, banks in Europe have used this system.

The new system in the USA is less secure than option B but cheaper to install.

5  
79

International University, VNU-HCMC

## Security within an Organization: People

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Many security problems come from people inside the organization**

- In a large organization, there will be some dishonest and disgruntled employees.
  - > Dishonest (e.g., stealing from financial systems)
  - > Malicious
- Security relies on trusted individuals. What if they are dishonest?

**People are intrinsically insecure**

- Careless (e.g., leave computers logged on, share passwords)

80

International University, VNU-HCMC

## Design for Security: People

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

- Make it easy for responsible people to use the system (e.g., make security procedures simple).
- Make it hard for dishonest or careless people (e.g., password management).
- Train people in responsible behavior.
- Test the security of the system thoroughly and repeatedly, particularly after changes.
- Do not hide violations.

81

International University, VNU-HCMC

## External Intruders

**All network systems are vulnerable to security breaches by external intruders:**

- financial
- malicious
- secrets
- and worse

Modern software is so complex that it is impossible to eliminate all vulnerabilities.

Many skilled individuals and organizations are continually seeking to discover and exploit new vulnerabilities.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

82

International University, VNU-HCMC

## External Intruders

**Examples of external security vulnerabilities:**

- unauthorized access – modify software, install listening devices
- backdoors – bypass authentication
- denial of service – overload and other forms of blocking
- eavesdropping
- spoofing
- phishing etc., etc.

*This list is derived from Wikipedia*

International University, VNU-HCMC

**External Intruders: Minimizing Risk**

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

There is no way to guarantee security from external intruders, but careful software development can make a major difference.

**How to minimize the risks:**

- System design – secure protocols, authentication, barriers to access
- Programming – defensive programming and rigorous testing
- Operating procedures – backup, auditing, vulnerability testing
- Training and monitoring personnel

84

International University, VNU-HCMC

**Minimizing Risks: System Architecture**

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**The system architecture can minimize risks in various ways:**

- Secure protocols, e.g., HTTPS encryption.
- Authentication, e.g., encryption of passwords in transmission and when stored, two factor authentication.
- Barriers, e.g., firewalls, private networks, and virtual private networks.
- Data security, e.g., encryption of stored data, backup.

85

International University, VNU-HCMC

## Security Techniques: Barriers

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Place barriers that separate parts of a complex system:**

- Isolate components, e.g., do not connect a computer to a network
- Firewalls
- Require authentication to access certain systems or parts of systems

Every barrier imposes restrictions on permitted uses of the system.

Barriers are most effective when the system can be divided into subsystems.

Example: Integration of Internet Explorer into Windows

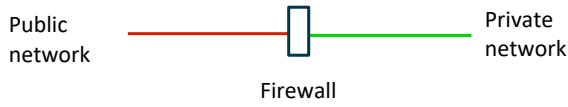

86

International University, VNU-HCMC

## Barriers: Firewall

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Firewall

A **firewall** is a computer at the junction of two network segments that:

- Inspects every packet that attempts to cross the boundary
- Rejects any packet that does not satisfy certain criteria, e.g.,
  - > an incoming request to open a TCP connection
  - > an unknown packet type

Firewalls provide increased security at a loss of flexibility, inconvenience for users, and extra system administration.

87

International University, VNU-HCMC

## Security Techniques: Authentication & Authorization

**Authentication** establishes the identity of an agent:

- What does the agent know (e.g., password)?
- What does the agent possess (e.g., smart card)?
- What does the agent have physical access to (e.g., crt-alt-del)?
- What are the physical properties of the agent (e.g., fingerprint)?

**Authorization** establishes what an authenticated agent may do:

- Access control lists
- Group membership

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

88

International University, VNU-HCMC

## Example:

### An Access Architecture for Digital Content

```

graph TD
    User[User] -- Authentication --> Auth[Authentication]
    User -- Role --> Role[Role]
    Auth --> AuthCloud((Authorization))
    Role --> AuthCloud
    DM[Digital material] -- Attributes --> AuthCloud
    AuthCloud -- Policies --> AuthCloud
    AuthCloud --> Actions[Actions]
    Actions -- Operations --> AuthCloud
  
```

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

89

International University, VNU-HCMC

## Security Techniques: Encryption

Allows data to be stored and transmitted securely, even when the bits are viewed by unauthorized agents and the algorithms are known.

```

graph LR
    X1[X] -- Encryption --> Y1[Y]
    Y2[Y] -- Decryption --> X2[X]
  
```

- Private key and public key
- Digital signatures

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

90

International University, VNU-HCMC

## Minimizing Risks: Programming

**The software development challenge**

- develop secure and reliable components
- protect whole system so that security problems in parts of it do not spread to the entire system

**A large system will have many agents and components**

- each is potentially unreliable and insecure
- components acquired from third parties may have unknown security problems

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

91

International University, VNU-HCMC

## Minimizing Risks: Programming

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**The commercial off-the-shelf problem**

- Developers of off-the-shelf software have considerable incentives to supply software with many options and features.
- In developing such software rapidly, they need more incentives to be thorough about security.

92

International University, VNU-HCMC

## Programming Secure Software

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Programs that interface with the outside world (e.g., web sites, mail servers) need to be written in a manner that resists intrusion.

For the top 25 programming errors, see: *Common Weakness Evaluation: A Community-Developed Dictionary of Software Weakness Types*.

<http://cwe.mitre.org/top25/>

- Insecure interaction between components
- Risky resource management
- Porous defenses

Project management and test procedures must ensure that programs avoid these errors.

93

International University, VNU-HCMC

## Programming Secure Software

The following list is from the SANS Security Institute, *Essential Skills for Secure Programmers Using Java/JavaEE*, <http://www.sans.org/>

- Input handling
- Authentication & session management
- Access control (authorization)
- Java types & JVM management
- Application faults & logging
- Encryption services
- Concurrency and threading
- Connection patterns

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

94

International University, VNU-HCMC

## Minimizing Risks: Procedures

**The operating procedures must anticipate security problems.**

A senior member of staff must have responsibility for security.

**Equipment**

- All system software should be kept up to date with latest security patches.
- All systems should run up to date virus checking software.
- Rules about passwords, personal equipment, and non-standard software should be explicit.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

95

International University, VNU-HCMC

## Minimizing Risks: Procedures

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Routine checks

- Run network security tests regularly.
- Run password checkers.

Training

- Keep staff informed about security. Ask for their advice.

96

International University, VNU-HCMC

## Operations: Recovery

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Sooner or later every system fails because of hardware, software, operational, or security problems. The operating procedures must anticipate loss of data and damage to systems, which can happen at any moment.

Backup techniques

- At regular intervals check point the system
- At regular intervals backup all data.
- Keep full audit trails of all important transactions

Recovery software

- Recovery software is complex. It needs to be tested regularly in realistic situations.
- A good practice is to rebuild the entire system, but this may not be possible with large collections of data.

97

 International University, VNU-HCMC

## Security in the Software Development Process

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

### Conclusion

You can never guarantee that a system is completely secure, but you can do a great deal to minimize the risks and to be able to recover from problems.

98

 International University, VNU-HCMC

## Outlines

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

- System architecture
- Three popular architectural styles
- Security
- Performance

99

International University, VNU-HCMC

## Performance of Computer Systems

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**In most computer systems**  
The cost of people is much greater than the cost of hardware

**Yet performance is important**  
A single bottleneck can slow down an entire system  
Future loads may be much greater than predicted

100

International University, VNU-HCMC

## When Performance Matters

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

- **Real time systems** when computation must be fast enough to support the service provided, e.g., fly-by wire control systems have tight response time requirements.
- **Very large computations** where elapsed time may be measured in days, e.g., calculation of weather forecasts must be fast enough for the forecasts to be useful.
- **User interfaces** where humans have high expectations, e.g., mouse tracking must appear instantaneous.
- **Transaction processing** where staff need to be productive and customers not annoyed by delays, e.g., airline check-in.

101

International University, VNU-HCMC

## High-Performance Computing

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**High-performance computing:**

- Large data collections (e.g., Amazon)
- Huge numbers of users (e.g., Google)
- Large computations (e.g., weather forecasting)

Must balance cost of hardware against cost of software development

- Some configurations are very difficult to program and debug
- Sometimes it is possible to isolate applications programmers from the system complexities

102

International University, VNU-HCMC

## Performance challenges for all software systems

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Tasks**

- Predict performance problems before a system is implemented.
- Design and build a system that is not vulnerable to performance problems.
- Identify causes and fix problems after a system is implemented.

103

International University, VNU-HCMC

## Performance challenges for all software systems

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Basic techniques**

- Understand how the underlying hardware and networks components interact with the software when executing the system.
- For each subsystem calculate the capacity and load. The capacity is a combination of the hardware and the software architecture.
- Identify subsystems that are near peak capacity.

**Example**

Calculations indicate that the capacity of a search system is 1,000 searches per second. What is the anticipated peak demand?

104

International University, VNU-HCMC

## Interactions between Hardware and Software

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Examples**

- In a distributed system, what messages pass between nodes?
- How many times must the system read from disk for a single transaction?
- What buffering and caching is used?
- Are operations in parallel or sequential?
- Are other systems competing for a shared resource (e.g., a network or server farm)?
- How does the operating system schedule tasks?

105

International University, VNU-HCMC

**Look for Bottlenecks**

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Usually, CPU performance is not the limiting factor.

**Hardware bottlenecks**

- Reading data from disk
- Shortage of memory (including paging)
- Moving data from memory to CPU
- Network capacity

**Inefficient software**

- Algorithms that do not scale well
- Parallel and sequential processing

106

International University, VNU-HCMC

**Look for Bottlenecks**

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**CPU performance is a limiting constraint in certain domains, e.g.:**

- large data analysis (e.g., searching)
- mathematical computation (e.g., engineering)
- compression and encryption
- multimedia (e.g., video)
- perception (e.g., image processing)

107

International University, VNU-HCMC

## Timescale of Different Components

	Operations per second
CPU instruction:	2,000,000,000
Disk latency:	200
Disk read:	100,000,000 bytes
Network LAN:	10,000,000 bytes

Actual performance may be considerably less than the theoretical peak.

108

International University, VNU-HCMC

## Look for Bottlenecks: Utilization

Utilization is the proportion of the capacity of a service that is used on average.

**Utilization** = proportion of capacity of service that is used

$$= \frac{\text{mean service time for a transaction}}{\text{mean inter-arrival time of transactions}}$$

When the utilization of any hardware component exceeds 0.3, be prepared for congestion.

Peak loads and temporary increases in demand can be much greater than the average.

109

International University, VNU-HCMC

## Predicting System Performance

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

- Direct measurement on subsystem (benchmark)
- Mathematical models (queueing theory)
- Simulation

All require detailed understanding of the interaction between software and hardware systems.

110

International University, VNU-HCMC

## Mathematical Models

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

### Queueing theory

Good estimates of congestion can be made for single-server queues with:

- arrivals that are independent, random events (Poisson process)
- service times that follow families of distributions (e.g., negative exponential, gamma)

Many of the results can be extended to multi-server queues.

*Much of the early work in queueing theory by Erlang was to model congestion in telephone networks.*

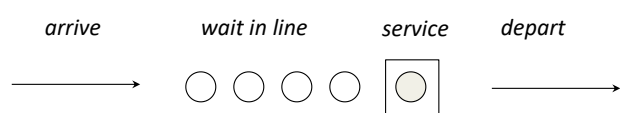

111

International University, VNU-HCMC

## Mathematical Models: Queues

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

### Single server queue

arrive      wait in line      service      depart

Examples

- Requests to read from a disk (with no buffering or other optimization)
- Customers waiting for check in at an airport, with a single check-in desk

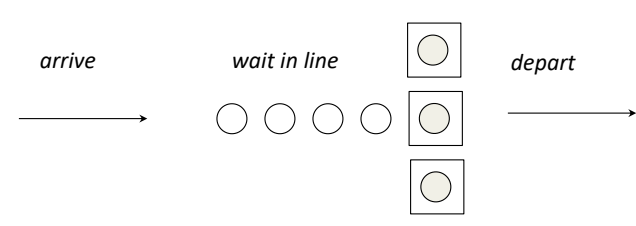

112

International University, VNU-HCMC

## Queues

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

### Multi-server queue

arrive      wait in line      service      depart

Examples

- Tasks being processed on a computer with several processors
- Customers waiting for check in at an airport, with a several check-in desks

113

International University, VNU-HCMC

## Techniques: Simulation

Build a computer program that models the system as set of states and events.

- advance simulated time**
- determine which events occurred**
- update state and event list**
- repeat**

Discrete time simulation: Time is advanced in fixed steps (e.g., 1 millisecond)

Next event simulation: Time is advanced to next event

Events can be simulated by random variables (e.g., arrival of next customer, completion of disk latency), or by using data collected from an operational system.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

114

International University, VNU-HCMC

## Behavior of Queues: Utilization

The exact shape of the curve depends on the type of queue (e.g., single server) and the statistical distributions of arrival times and service times.

mean delay before service begins

Utilization of service

0 1

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

115

International University, VNU-HCMC

## Measurements on Operational Systems

### Measurements on operational systems

- Benchmarks: Run system on standard problem sets, sample inputs, or a simulated load on the system.
- Instrumentation: Clock specific events.

If you have any doubt about the performance of part of a system, experiment with a simulated load.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

116

International University, VNU-HCMC

## Example: Web Laboratory

Benchmark: throughput v. number of CPUs on a symmetric multiprocessor

117

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

International University, VNU-HCMC

## Case Study: Performance of Disk Farm

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**When many transaction use a disk farm, each transaction must:**

- wait for specific disk
- wait for I/O channel
- send signal to move heads on disk
- wait for I/O channel
- pause for disk rotation (latency)
- read data

Close agreement between: results from queuing theory, simulation, and direct measurement (within 15%).

118

International University, VNU-HCMC

## Fixing Bad Performance

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**If a system performs badly, begin by identifying the cause:**

Instrumentation. Add timers to the code. Often this will reveal that delays are centered in a specific part of the system.

Test loads. Run the system with varying loads, e.g., high transaction rates, large input files, many users, etc. This may reveal the characteristics of when the system runs badly.

Design and code reviews. Team review of system design, program design, and suspect sections of code. This may reveal an algorithm that is running very slowly, e.g., a sort, locking procedure, etc.

Find the underlying cause and fix it or the problem will return!

119

International University, VNU-HCMC

## Predicting Performance Change: Moore's Law

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Original version:**  
The density of transistors in an integrated circuit will double every year. (Gordon Moore, Intel, 1965)

**Current version:**  
Cost/performance of silicon chips doubles every 18 months.

120

International University, VNU-HCMC

## Moore's Law: Rules of Thumb

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

**Planning assumptions**  
Silicon chips: cost/performance improves 30% / year

- in 12 years = 20:1
- in 24 years = 500:1

Magnetic media: cost/performance improves 40% / year

- in 12 years = 50:1
- in 24 years = 3,000:1

These assumptions are conservative. During some periods, the increases have been considerably faster.

Recently, the rate of performance increase in individual components, such as CPUs, has slowed down, but the overall rate of increase has been maintained by placing many CPU cores on a single chip.

121

International University, VNU-HCMC

## Moore's Law and System Design

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Feasibility study:	2013		
Production use:		2016	
Withdrawn from production:			2026
Processor speeds	1	2.2	30
Memory sizes:	1	2.2	30
Disk capacity:	1	2.2	30
System cost:	1	0.4	0.03

122

International University, VNU-HCMC

## Moore's Law Example

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

Will this be a typical laptop?

	2017	2027
Processors	2 x 2.5 GHz	8 x 10 GHz
Memory	8 GB	200 GB
Disc	500 GB	15 TB
Network	1 Gb/s	25 Gb/s

or 100 processors?

Surely there will be some fundamental changes in how this this power is packaged and used.

123

International University, VNU-HCMC

## Parkinson's Law

**Original:**  
Work expands to fill the time available. (C. Northcote Parkinson)

**Software development version:**

- (a) Demand will expand to use all the hardware available.
- (b) Low prices will create new demands.
- (c) Your software will be used on equipment that you have not envisioned.

Assoc. Prof. Nguyen Thi Thuy Loan, PhD

124

International University, VNU-HCMC

## False Assumptions from the Past

**Be careful about the assumptions that you make**  
Here are some past assumptions that caused problems:

- Unix file system will never exceed 2 GB ( $2^{32}$  bytes).
- AppleTalk networks will never have more than 256 hosts ( $2^8$  bits).
- GPS software will not last more than 1024 weeks.
- Two bytes are sufficient to represent a year (Y2K bug).

etc, etc,...

Assoc. Prof. Nguyen Thi Thuy Loan, PhD
